TRAVEL

PITCH DECK

AI-powered travel planning and trip management platform

A plan-first platform where travelers can build, manage, book, and receive support for complete trips with an AI travel assistant.

Private MVP / Product in development

Caleb Perez

From real travel operations to an AI-native service experience.

Founder context

WHY THIS PROBLEM MATTERS

Zalmar Travel comes from the intersection of two real worlds:

- More than a decade of family exposure to travel agency operations.
- Direct understanding of how fragmented trip planning becomes for customers and advisors.
- A self-driven path in software, AI, product thinking, and technical systems.
- The goal: turn real operational pain into a smarter platform experience.

Builder + Travel Ops Insight

The problem

Fragmented services

Flights, hotels, transfers, activities, and documents are usually managed separately.

Manual agency workflows

Advisors spend significant time re-quoting, updating, and following up with clients.

Constant changes

Indecision, provider changes, and availability shifts create friction before booking.

Weak continuity

Support often ends at the sale instead of continuing through the full trip experience.

The opportunity is not just to sell travel services. It is to manage the full travel plan as one intelligent, continuous experience.

Target customer

PRIMARY USERS

Recurrent travelers and active people constantly in movement.

- Travelers who want one place to organize complete trips.
- Users who need flexibility: manual control or AI-assisted management.
- Customers who value personalized support before, during, and after travel.
- A travel agency operation that needs a clearer system to manage complex plans.

Plan-first, not cart-first

The solution

Zalmar Travel is designed as a plan-first system.

- The plan becomes the central object.
- Every service lives in the context of that plan.
- The platform can support both self-service and assisted service.

The AI layer

UNIQUE DIFFERENTIATOR

Not a generic chatbot. A travel assistant attached to a specific plan.

- Understands the selected services, quote status, trip details, and pending actions.
- Can help users ask questions, review options, request changes, or continue planning.
- Permission-based: the user decides when the AI can make real changes.
- Human escalation stays available for personalized service and post-sale support.

Product experience

Search & compare services

Booking and plan confirmation

Reservations and travel follow-up

The MVP currently prioritizes functionality, backend validation, and product logic. The next major step is a full UX/UI redesign to make the experience feel premium, clear,

MVP visual references - not final design

Current progress

WHAT EXISTS TODAY

- Private functional MVP with plan-first product logic.
- Backend and integrations are partially ready and still being validated.
- Frontend exists as an MVP interface mainly to test backend functionality.
- Product documentation and UX/UI redesign package already prepared.

TECHNOLOGY DIRECTION

- Travel services: Hotelbeds and Duffel as initial provider directions.
- Payments: Stripe as the payment orchestration direction.
- AI: OpenAI models for plan-based agent capabilities.
- Architecture: designed to keep trip data readable and actionable for AI.

Business model hypotheses

Reservation commission

Revenue tied to completed plan or service bookings.

Service fee

Transparent fee per confirmed travel service or full plan.

Personalized package fee

Higher-touch planning supported by human advisors.

Premium AI assistant

Subscription-style access to advanced AI travel management features.

The priority now is to finish the core MVP, validate with real customers, and then choose the most natural monetization model.

Roadmap

1

Complete provider integrations

Stabilize flows for hotels, flights, transfers, and activities.

2

Redesign UX/UI from the ground up

Move from functional MVP interface to a polished travel-tech product.

3

Expand the AI agent

Improve plan-based understanding, permissions, actions, and support workflows.

4

Validate with real customers

Use agency experience and existing demand to test with actual travel plans.

5

Launch first commercial version

Combine automation, human service, and plan-level booking management.

ZALMAR
TRAVEL

A new standard for intelligent travel planning and complete trip management.

Vision

To combine AI, human assistance, and real travel operations into one platform that helps users manage entire travel plans with clarity, personalization, and continuity.
